Abstract (en)
[origin: WO2009000287A1] The invention relates to a sheet-like composite (10) comprising at least two groups of elements (12, 14) which each have a greater span in their longitudinal direction (22, 24) than in a direction extending transversely to the longitudinal direction (24, 22), wherein the elements (12) of a first group are flexurally rigid and are arranged with their longitudinal direction (22) extending obliquely, and in particular transversely, to the longitudinal direction (24) of the elements (14) of a second group, and wherein at least some of the elements (12) of the first group have a wooden surface constituting a non-metallic surface, characterized in that the sheet-like composition (10) is embodied as a fabric, in that the elements (12) of the first group form the weft of the sheet-like composite (10), and in that the elements (14) of the second group form the warp of said composite.
