Abstract (en)
[origin: WO2009015957A1] The invention relates to a fluid pump comprising, in a housing (1), a suction side (S) that is provided with a supply (Z) for the flowing medium and a pressure side (D) that is provided to withdraw the flowing medium. The suction side (S) and the pressure side (D) are fluidically separated from each other by an actuatable running wheel (4). At least one outlet (1a) and at least one inlet (1b) that is arranged in the region of the supply line (Z) are connected together via a fluid channel (2) in the pressure side (D) of the housing (1). Said fluid channel (2) is at least thermally connected in parts to components (3), the heat thereof being withdrawn. The invention also relates to the use of the fluid pump as a cool water pump in a motor vehicle.
