Abstract (en)
[origin: EP2172610A1] The mounting part (1) has an adjusting spindle (4) rotated in a mounting hole (7) of a carrier (2) or a joint receiving part (3) and secured against a shift in a spindle longitudinal direction. Diameter of the adjusting spindle is changed inside the mounting hole. The material of the carrier and/or the joint receiving part has a molding (8) that is formed by a plastic material formation. The molding controls the diameter of the mounting hole in sections, and cooperates with the change of diameter such that the adjusting spindle is secured against a shift in spindle longitudinal direction.
