Abstract (en)
[origin: WO2009015739A1] The present invention relates to an agricultural machine for soil cultivation in the form of a short disk harrow for heavy, deep soil cultivation, allowing land to be cultivated down to a depth of 25 cm. The disk harrow (10) comprises a main frame (40, 42) and at least one carrier (22), wherein a plurality of disks (20), at least two, is attached to the carrier (22). The disks (20) are disposed on the carrier (22) next to one another and, along with the carrier, form a rigid unit (18), a so-called disk system. Said unit (18) is rotatably mounted on the main frame via connector elements (30) connected to said main frame (40, 42) in a fixed manner and the depth setting of the disks (20) may be adapted to the requirements of the soil and adjusted accordingly.
