Abstract (en)

[origin: WO2009013058A1] A method for the determination of a fuel mass of a preinjection injected into at least one combustion chamber of an internal combustion engine by means of at least one injection under high pressure is characterized in that a corrective variable is determined for the preinjection by means of a comparison between a measure for the actual amount of injected fuel of at least one test post-injection carried out for a predetermined target amount of a desired preinjection due to a measure, and the measure for the target amount.
