Abstract (en)

The display case comprises a foldable structure (10) with two panels (11, 12) facing one another and attached at the side edges thereof. Between the panels of the structure (10) there is an expanding device comprising a first laminar body (30) with opposed first and second edges (31, 32) and at least one insertion portion (34) extending between at least one intermediate stop edge (33) and one of said first and second edges, and a second laminar body (40) with opposed first and second edges (41, 42) and a slot (43) between said first and second edges. The insertion portion is inserted in the slot and the slot (43) and the stop edge (33) define a fulcrum line along which the first and second laminar bodies (30, 40) can rotate with respect to one another towards an expanded position in cooperation with an elastic band (5).
