Abstract (en)
[origin: WO2009019727A1] A reversible electric lock (1), comprising at least one pair of electromechanical actuators (2), which are connected to a respective power supply circuit (3) and are interposed between at least one element for locking the door (4) in the closed configuration and at least one handle passage (6) which can rotate by actuation of the handle, and at least one seat (8) for a cylinder (9) which is functionally associated with means for retracting the at least one element for locking the door (4) in the closed configuration. The lock (1) further comprises at least one sensor which is meant to detect, even indirectly, the presence of the cylinder (9) in at least one respective seat of the lock (1), the sensor being controlled by an electric switch for connecting alternatively to an external power source (13) one of the two power supply circuits (3) of the electromechanical actuators (2).
