Abstract (en)

[origin: WO2009013652A1] A lock system comprising a main lock (1) and a planetary lock (4), the main lock comprising at least one claw (2) which keeps the lock system in a closed position; at least one sliding lever (3) which transmits a drive to the planetary lock (4); the planetary lock (4) can be activated with a drive that it has received from the sliding lever (3), whereby the main lock (1) further comprises at least one coupling lever (5), the sliding lever (3) connected to the coupling lever (5), and whereby the sliding lever (3) can be activated with a drive that it has received from outside or inside release levers to open the main lock, by making a rotary motion around an axis of the coupling lever (5) and thereby driving the planetary lock (4) with the sliding lever (3) connected to coupling lever (5).
