Abstract (en)
[origin: FR2919494A1] The device has a rotating massing system (3) including massaging units (10) mounted on a support (2) and turned relative to the support around a rotation geometrical axis (X, X') defined by a material axles (15) of the support. Posts (6) of the support supports the material axles associated with the massaging units, where inclination of the geometric axis with respect to the posts is related to a position of an intermediate part (20) that is moved relative to the support. The part is located between the massaging units and connected to the material axles.
