Abstract (en)

[origin: EP2177367A1] The method involves providing stacked flat parts with perforations for receiving binding tongues (151) of an outer sheet (15). The tongues of the outer sheet are provided with an adhesive agent in a predetermined region. The tongues are attached to the perforations of the stacked flat parts such that the tongues are bent or spiral. An adhesive free-region of the tongues is brought in contact with the region of the tongues provided with the adhesive, in an overlapping manner. The overlapped contact regions are detachably connected by radiation energy. An independent claim is also included for a device for binding stacked flat parts such as paper sheets.
