Abstract (en)

[origin: EP2177439A1] The method involves providing the production unit (10) with an electrically driven drive (16) depending on a central mechanical speed in normal operation. The abnormal movement of the depending drive is monitored with respect to the obtained or exceeded threshold value. The threshold value is increased or decreased depending on the master values generated by actuating an actuation element (24). The movement of the dependent drive is monitored with respect to the threshold. An independent claim is included for a production unit with a safety control- or regulating unit.
