Abstract (en)

[origin: US2009058151A1] A device (1) for supporting a human body comprising at least one support element (10) defining a cross-sectional area (50) and at least one longitudinal bar (13), whereby the support element (10) is positionable in height and depth. A support bar (11) for each of the at least one support elements (10) is directly connected to the at least one longitudinal bar (13). The support bar (11) extends at least partly along a first longitudinal axis (12) of the at least one support element (10) through the at least one support element (10). The support bar (11) is eccentrically arranged in the cross-sectional area (50) of the at least one support element (10). The invention furthermore discloses an application of the device (1) for supporting a human body in a working system (35).
