Abstract (en)
[origin: WO2009021857A1] The invention relates to a door lock (1) with a housing (2) in which there is a bolt (3) which, in a first position projecting out of the housing (2), locks the door lock (1) and can be retracted at least partially into the housing (2) into a second position releasing the door lock (1), with a first spindle (4) for a closing mechanism which can be operated with a key, force transmission means (8) for manually moving the bolt (3) via the first spindle (4, 7), and a movable selector element (11) for changing over functional properties of the door lock (1). According to the invention, it is provided that the selector element (11) can be brought into a release position and into a securing position, wherein a first functional property of the door lock (1) can be obtained in the release position in which the bolt (3) can be brought into the first position via the force transmission means (8), and a second functional property of the door lock (1) can be obtained in the securing position in which a movement of the bolt (3) into the first position can be blocked via the force transmission means (8), and the selector element (11) is operatively connected to the bolt (3) in such a manner that, in each position of the selector element (11), a change in the functional property of the door lock (1) is possible via a movement of the selector element (11).
