Abstract (en)  
[origin: WO2009024245A1] The invention relates to a bullet (1) having a propellant charge casing (2) being at least partially filled with a propellant charge powder (13) and a projectile part (3) connected on the front of the propellant charge casing (2), wherein the propellant charge casing (2) comprises a casing cover (7), a casing sheath (8) and a casing base (9), and wherein the casing sheath (8) is connected to the projectile part (3) via the casing cover (7) and to the casing base (9) via a spring steel sheet (10). In order to achieve that different amounts of propellant charge powder (13) can be filled into the same propellant charge casing (2) without igniting the propellant charge at undesirable blast waves, the invention provides to dispose a sack-shaped container (14) being completely filled with the respective amount of propellant charge powder (13) inside the propellant charge casing (2) such that the container - and thus also the propellant charge powder - extends in the direction of the central longitudinal axis (100) of the bullet (1).
