Abstract (en)
[origin: EP2020776A1] A method of restarting a network (1) consisting of network modules (2), the method comprising the steps of: #c recording error data associated with errors occurring in the network, the error data including sets of network variables applying when the errors occurred, #c upon detection of a start-up error, deriving a new set of network variables from the recorded error data, for example by changing the order of two network variables, and #c restarting the network while using the new set of network variables. The network modules (2) may be wireless modules, while the network variables may comprise communication channel numbers or network addresses. The method may be carried out using a network control device (4) coupled to a central network unit (3).
