Abstract (en)
[origin: EP2182376A2] The method involves receiving four radio signals (4a-4e) sent by different transmitter stations (1a-1e), and determining a channel impulse response of a transmission channel for each of the received radio signals. A direct signal path is treasured for each of the received radio signals on the basis of channel impulse response. A receipt position of the radio signals is determined by evaluating the estimated direct signal paths of the received radio signals. Independent claims are included for the following: (1) an arrangement of multiple transmitter stations; and (2) a positioning device.
