Abstract (en)
[origin: EP2182740A1] The method involves recording data concerning an alignment of a hearing device together with direct or indirect time information. The time duration for activating the alignment is automatically determined, where an automatic adaptation of a parameter of the hearing device depends on the determined time duration and the alignment. An adaptation time is controlled based on the determined time duration. The activation of a hearing program, a volume, a sound or a regulating depth of noise reduction is concerned for the alignment. An independent claim is also included for a hearing device has a data logging device.
