Abstract (en)

[origin: EP2182741A1] The device has microphone devices (10, 11) receiving a sound signal, and receiving devices (12, 13) receiving electrical and electromagnetic signals. A classification device (15) determines an acoustic situation from signals (m, e) of the microphone devices and the receiving devices. A signal processing device processes the signals of the microphone devices and the receiving devices depending on an output signal (a) of the classification device. The signals of the microphone devices and receiving devices of the classification device are adjusted for a situation device. An independent claim is also included for a method for operating a hearing device.
