Abstract (en)

[origin: WO2009013147A1] The method for the control of a washing process is to be carried out in a washing machine controllable with a program control device. The washing machine is to be equipped for this purpose with a detergent-adding device and with a sensor for the detection of a value T for the clouding of the washing liquid. So that the washing machine recognizes the type of detergent used and can adapt the chosen washing process thereto, the course PL1, PL2 of the clouding values T are detected and plotted for a certain duration D of a section A+B of the washing process, during which detergent is added to the washing liquid. In addition the detergent type is determined from the plotted course PL1, PL2, and the washing process
