Abstract (en)
[origin: WO2009030851A2] The invention relates to an awning comprising a bearing structure (2) comprising a chassis supporting a winding bar (12) collaborating with control and rotational drive means, a front profile (11) and two articulated arms (5) pivot-mounted on the chassis of the bearing structure at a first end and on the front profile (11) at a second end such that the front profile (11) can move between a furled position (R) and an unfurled position (D). The awning also comprises an awning fabric (4), the two opposite sides of which are connected one of them to the front profile (11) and the other to the winding bar (12) of the bearing structure (2) and means (3) of attaching the bearing structure (2) to a support. The means of attachment comprise a single central bracket (3) attached to the support and to which a central region (C) of the chassis of the bearing structure is attached. In addition, the points (8) at which the two articulated arms (5) are articulated to the chassis are situated in or near the central region (C) via which the chassis is attached to the bracket (3).
