Abstract (en)
[origin: WO2009011571A1] A package for a fluid comprises a substantially tub-like container (1) with a product space (2) for the purpose of receiving the fluid therein. The product space is bounded by a compressible wall (3) with an upper edge (4) from which a lateral extension (5) extends locally. An outflow channel (6) is situated in the extension (5). The container is provided with a sealing foil (11) which is adhered to the upper edge in hermetically sealed manner around the product space and up to a position beyond the outflow channel. The lateral extension comprises a weakening zone (10) along a predetermined break line which intersects the outflow channel (6). The sealing foil comprises a flexible base layer and is firmly connected therewith to the upper edge of the container. The weakening zone follows a path varying from a straight line.
