Abstract (en)

[origin: WO2009015762A1] The method relates to a device and a method for depositing continually vertically stacked flat material pieces. In addition to a support surface (2) that is movable back and forth between a receiving position and a delivery position, wherein said support surface is disposed in the receiving position such that it receives the flat material pieces to be stacked in the form of at least one substantially vertical stack, the device also comprises an auxiliary support surface (3). The auxiliary support surface (3) is movable back and forth between a rest position and a working position, wherein said auxiliary support surface is disposed in the working position so as to receive the flat material pieces to be stacked in the form of at least one substantially vertical stack instead of the support surface.
