Abstract (en)  
[origin: WO2010001420A1] A transmission arm for actuating devices of gates or doors is described, comprising a first rigid segment (20) connectable to a motor (26), a second rigid segment (22) rotatably pivoted at one end to the first segment and at the other end to the gate or door (GT). For easing the installation and the fitting to different actuating devices, the arm comprises means (30; 60) for longitudinally adjusting inside the first and/ or second segment the position of a relevant rotation axis (X) thereof. A segment, once the length thereof has been adjusted, can be cut.
