Abstract (en)

[origin: EP2186773A1] The nozzle has a manually operated switch lever (8) that is movable between a closing position, in which fuel is not delivered, and an opening position, in which fuel is delivered. The switch lever is spring-loaded in a direction of closing position by a return spring, and arrives automatically into the closing position with recessive hand force. An obstruction aid i.e. pivotable lever (10), reduces obstruction force needed for holding a switch lever in a determined opening position. The obstruction aid comprises an obstruction element movable between a stop position and a release position.
