Abstract (en)
[origin: EP2186958A2] The arrangement has a rear ventilation unit (4) e.g. extension, at a lower surface of an insulation element (1) and/or insulating surface (15) for rear ventilation and/or removal of water vapor from a region between a wall (13) i.e. outer wall, and the insulating surface. A condensate converter (25) between the insulation surface and the wall converts condensation and/or wall moisture into water vapor. The converter sucks water from a completely moistened masonry, guides the water and/or the water vapor through plaster thickness and delivers the water and/or the vapor to the surrounding. The rear ventilation unit e.g. ridge and recess, is provided at the lower surface of the insulation element and/or insulating surface.
