Abstract (en)

[origin: WO2009037092A1] A holder for temporarily holding the automatic lung device of breathing apparatus comprises a hollow cylinder (1) made of stiff material, with internal diameter sections which decrease in size step by step and into which there is formed an inner thread (4a, 5a) with a small number of thread turns corresponding to the standardized outer thread of the automatic lung devices. The external diameter of the hollow cylinder is of a size, and designed with a locking edge (3a) extending about the circumference, such that an automatic lung device with a standardized plug connector can also be secured. Thus, when not in use, automatic lung devices with different standardized connectors are held quickly, safely and releasably.
