Abstract (en)
[origin: WO2009031175A1] The present invention relates to a tower, in particular but not exclusively for supporting telecommunication appliances, comprising a plurality of bars next to one another along the respective sides so as to make a hollow parallelepiped structure with polygonal section, each bar comprising a bar body defining at least one side of said parallelepiped structure. The bars are connected to each other by longitudinal coupling appendices, for example bolted to one another. Moreover, multiple bars may be superimposed in height. In any case, the resulting tower is free from welds and easy to store, carry and assemble.
