Abstract (en)
[origin: WO2009027253A1] Traffic light installations for generating metainformation on the basis of input information about the surroundings of the traffic light installation. The traffic light installation acts as a data pool and can use the information measured by it or obtained from adjacent vehicles to independently simulate a road section. From the input information, the traffic light installation can also generate metainformation which is communicated to other vehicles and thus results in a constant flow of traffic.
