Abstract (en)

The object of the present invention is a cladding piece used principally to cover walls and the method for mounting said piece to cover both the wall area and to resolve corners. The present solution permits the use of large pieces in which the outside face of said piece is composed of stone of very little thickness, and resolves the problems raised by lack of resistance and fragility which a single thin stone layer would demonstrate, as well as flatness and adequate meeting of adjacent pieces when these cover a large area.
