Abstract (en)

The present invention relates to a three-wing hinge for fixtures that comprise a first element and a second element rotating around a rotation axis. The hinge comprises a first component (21) and a second component (22) arranged to be fastened to one element (5, 7) of the elements of the fixture, and a third component (23) in intermediate position between the first (21) and the second component (22), and the first and second components are arranged to rotate relative to the third component around the rotation axis. The hinge is configured so that the first component (21) is pivoted on the third component in an axially adjustable way and the second component (22) is slidingly pivoted on said third component (23) so as to be able to axially slide relative to said third component (23) along the rotation axis. The present invention also relates to a method of making a three-wing hinge.
