Abstract (en)
[origin: CA2698411A1] The invention relates to a device for transferring continuous casting slabs made of continuous casting strands disposed parallel at an equal distance from each other into an individual production line disposed on an imaginary extension of one of the continuous casting strands, wherein the cycle time during the transfer or forwarding of the slabs is to be reduced. This is achieved by a ferry, which can be incrementally transversely displaced between the ends of the continuous casting strands and the start of the production line and which has berth that are used for the substantially simultaneous receipt or delivery of the slabs.
