Abstract (en)

[origin: WO2009024469A1] The present invention relates to a nacelle comprising a mid-section and an aft- section formed from two half-shells (9a) interconnected by a locking device (10) actuated by an operating handle (13) equipped with a secondary locking system comprising a latching member (19) for latching said operating handle in its locking position, said mid-section being formed from two cowls which can be deployed between a working position and a maintenance position, characterized in that the latching member and a region of the internal face of one of the two cowls are designed so as to butt one against the other in order to prevent the closure of said cowl if the operating handle is not situated in its locking position and/or if the latching member is not in its latching position.
