Abstract (en)
[origin: WO2009039948A2] During the production of hydrocarbons, especially C2-C4 olefins, by means of a combined installation comprising a steam cracker and at least one reactor for reacting a feedstock mixture containing steam and at least one oxygenate, the respective intermediate flows of the steam cracker and the reactor are combined at least in part. In order to increase the yield of valuable products, a shape-selective zeolite material is used as a catalyst for reacting the oxygenate in the reactor, and at least part of the product flows obtained after penetrating the combined installation are recirculated to the steam cracker and/or the reactor.
