Abstract (en)

[origin: WO2009036935A1] The invention relates to a method for configuring an operating device (V) for illumination means (L), particularly an electronic ballast for gas discharge lamps, wherein different types of an illumination means (L) may be connected to the operating device (V). The method comprises the following steps: a) identifying a present connection configuration, selected from a plurality of possible connection configurations, b) determining the type of lamp based on the connection configuration identified, for example, using a table, and c) establishing the operating parameters for the type of lamp identified, which are stored in a table for each lamp type.
