Abstract (en)  
[origin: EP2191805A1] The device has a long massage opening (2) for receiving a male sexual organ. A drive device (4) is extended along a longitudinal axis (LA) of the opening for massaging the received organ. The drive device includes a number of support surfaces (5), which are arranged radially spaced from the axis and sectionally enclose the opening. The drive device oscillatingly and radial-inwardly deforms the opening along the axis. The opening is formed by a sectioned tubular mold part made of rubbery-elastic material. An excentric section (7.1) is made of elastomer or expanded polyurethane.
