Abstract (en)
[origin: CA2692366A1] The invention relates to an actuating handle with a stop element for a door. The stop element comprises at least one attachment element that can be fixed to the door, a handle for actuating the door and/or a closure device arranged in the door. The attachment element, which is arranged and/or designed in such a way that it can be fixed at and/or in the closure device perpendicularly to the longitudinal axis of the stop element is connected with the stop element and can be introduced into the closure device by passing through a lateral surface of the door. In this way, the mounting of the actuating handle is made easier and can be carried out independently of the respective installation situation, if possible without tools.
