Abstract (en)
[origin: EP2194608A1] The device (32) has a plug element (18) and a mating plug element (16) that comprise two plug element components (36, 38), where the mating plug element produces an electrical connection in a together-plugged condition. The two plug element components are relatively moved to each other within a play in a plug direction. The plug elements are integrally manufactured, where one of the plug element components is prestressed against the other plug element component by a spring element (22). An independent claim is also included for a method for assembling a plug-in connection device in an assembly.
