Abstract (en)

[origin: EP2196568A1] The lock (22) has a base body provided with a guide path (21) for a foot of a needle. A movable attachment part i.e. longitudinal slot (52), attaches the base body to a bearing. The movable attachment part moves a position of the lock in a movement direction, which is oriented perpendicular to a needle longitudinal direction and to a slide longitudinal direction. A needle bed is driven around a rotational axis. A recess (56) is provided at an end (55) at which the guide path starts, and a projection (58) is provided at an end (57) at which the guide path ends. An independent claim is also included for a knitting machine including a rope lock provided with a needle lock and a pin lock.
