Abstract (en)

[origin: EP2196617A1] The device (1) has an anti-lifting system comprising a latch that is mounted pivotingly on an inner wall of a lateral slide (4) between unlocking and locking positions. The latch co-operates with a hooking unit of the system to prevent lifting of a covering element (2), in the locking position. A pushing unit pushes the latch from the locking position towards the unlocking position under impulsion of displacement of slats (20, 22) of the covering element. The slats have two parts that are movable relative to each other and are respectively provided with the pushing and hooking units.
