Abstract (en)  
[origin: WO2009032553A2] The invention is an apparatus and computerized method of intravenously monitoring a patient's blood chemistry and transmitting real time measurements to an electronically controlled closed loop system that auto-regulates blood osmolality and glucose level with medications infused through a new catheter design. The closed loop system utilizes a glucose algorithm and an osmolality algorithm implemented in hardware and software to control the flow of dextrose, insulin and hypertonic saline to a patient in an effort to achieve better patient outcomes in instances of trauma and illnesses, particularly those that involve brain swelling.
