Abstract (en)

[origin: US2009076649A1] A method and a device for transporting items, in particular mail items. uses multiple transport processes for transporting the items respectively to a processing system. For each item, a measurement is made before the transportation as to whether the item has a predefined characteristic, and if so, in what form. This measurement is executed afresh, after the item is fed to a processing system. For each item, it is determined by means of which transport process the item has been transported. To this end, it is determined which items with what form of the characteristic have been transported by means of which transport process.
