Abstract (en)
[origin: WO2009033887A1] Disclosed is an injection system for injecting fuel, comprising: a controllable actuator that provides a working lift for indirectly actuating a valve pin; a pilot valve that is arranged in a valve chamber of the high-pressure zone and has a valve mushroom; a supply throttle that is disposed between a high-pressure connection and a control chamber of the high-pressure zone in order to supply the fuel, said control chamber encompassing a control piston; a first discharge throttle located between the control chamber and the valve chamber; a first sealing edge of the valve chamber, said first sealing edge forming a first sealing seat along with the valve mushroom when the valve is closed in order to seal the piston chamber and the valve chamber from each other; a second sealing edge of a piston chamber that has a valve piston, said second sealing edge forming a second sealing seat along with the valve piston during a maximum working lift of the actuator in order to at least substantially seal the piston chamber and the valve chamber from each other; and a second discharge throttle that connects the piston chamber (6) to the low-pressure zone (ND) between the first and the second sealing edge (16, 18). According to the invention, $d1 > d2 > d3$, $d1$ being the minimum diameter of the first discharge throttle, $d2$ being the minimum diameter of the second discharge throttle, and $d3$ being the minimum diameter of the supply throttle.
