Abstract (en)
A liquid crystal medium based on a mixture of polar compounds with negative dielectric anisotropy ($\Delta\epsilon$) has a γ_1 (rotational viscosity)/ Δn ratio of 6-45 at a clear point of above 60[deg]C and a $\Delta\epsilon$ of ≈ 2.3 . (sic: this range of ratio values does not appear to conform to actual values for γ_1 and Δn given in dependent claims and elsewhere in the specification).

Abstract (de)
Die vorliegende Erfindung betrifft ein flüssigkristallines Medium auf der Basis eines Gemisches von polaren Verbindungen mit negativer dielektrischer Anisotropie ($\Delta\epsilon$), dass sich dadurch auszeichnet, dass es bei einem Klärpunkt von $> 60^\circ\text{C}$ und einem $\Delta\epsilon$ von $\approx 2,3$ einen Wert für das Verhältnis $\gamma_1 / \Delta n$ im Bereich von 6-45 aufweist. Derartige Medien sind insbesondere geeignet für elektrooptische Anzeigen mit einer Aktivmatrix-Addressierung basierend auf dem ECB-, PA LCD-, FFS- oder IPS-Effekt.
