Abstract (en)

[origin: EP2199706A1] The system has a cooling circuit for executing a compression operation, in which a cooling medium is compressed to a high-pressure level over a compressor (11) and supplied to a condenser (12) and cooled. A pump (16) is connected parallelly to an expansion valve (13) and provided for pumping the cooling medium without pressure change during an additional pump operation such that a heat transport takes place from a heat absorbing heat exchanger to a heat releasing heat exchanger according to a heat exchanger principle.
