Abstract (en)
[origin: EP2199713A2] The container has a container body with two container layers that are in heat conductive contact with different thermal conductivities. The thermal conductivities differ by a factor greater than 10, particularly greater than 20, particularly greater than 100. A layer with lower thermal conductivity is formed from a material which comprises stainless steel, steel, ceramics, glass, nanomaterial or plastic material. Another layer with higher heat conductivity, is formed from a material which comprises aluminum, gold, carbon, copper, magnesium, brass, silver or silicon or alloys. Independent claims are also included for: (1) a device for handling, particularly centrifugation, stirring or cooling of goods, particularly a laboratory centrifuge; and (2) a method for producing a container.
