Abstract (en)
[origin: EP2200400A1] The device has a control unit for stopping control of an inverter when a safety control signal has a mode representing a failure state. A powering unit is provided with other control units, and cuts off a supply signal of the control units when another safety control signal has a mode representing failure state. The latter control units have an interface element and a transfer element, where the interface element receives a cutting signal from the transfer element.
