Abstract (en)

[origin: WO2009049839A1] The invention relates to a key (1) having an end (6) connected to a clevis (7) mounted in a housing (2) for rotation between a stowed position of the key in the housing and an exposed position of the key, and a control pusher (17) mounted in the clevis so as to be pivotally connected thereto and capable sliding between a clevis latching exposed position, in which the pusher includes at least one lug (25) received in a notch (26) in a portion of the housing, and a recessed position for releasing the pivotal movement of the clevis in which the lug exits the notch, a spring (18) being provided between the housing and the control pusher for elastically returning the clevis to the exposed position thereof and the control pusher to the latching position thereof, the notch being formed in a ring (13) mounted in the portion of the housing, and the ring having a hardness higher than that of the housing.
