Abstract (en)

[origin: EP2202173A1] The bag has a closing assembly (100) comprising a male closing element (110) and a female closing element (120), which are supported by a web (112) and another web. The former web is integrated with a wall (10) at a localized zone (114) non-superimposed on the corresponding male closing element to allow the articulation of the former web on the wall. The articulated web extends beyond the male closing element such that free end (115) of the articulated web is supported on an opposite wall (20) upon engagement of the male and female closing elements.
