Abstract (en)  
[origin: WO2009058632A1] A fluid isolation valve having a valve body with a first fluid flow port, a second fluid flow port and a fluid drain port with a valve in the fluid drain port. The valve body defines a fluid flow channel, a drain flow channel and a valve portion, wherein the valve portion is disposed in the valve body communicating with the first fluid flow port, the second fluid flow port and the fluid drain port. At least one flow diversion device is provided and disposed within the valve portion. The flow diversion device is configurable between a first configuration and a second configuration, such that when the flow diversion device is in the first configuration the first fluid flow port is communicated with the second fluid flow port. When the flow diversion device is in the second configuration the first fluid flow port is communicated with the fluid drain port.
