Abstract (en)  
[origin: EP2204333A1] The closure (1) has a hinge section pivoting an upper part (3) from a position to another position. The upper part is pivoted away from a lower part (2) around an opening angle in the latter position. A retaining device (30) has a pair of retaining sections (31, 32), which are detachably interconnected during pivoting of the upper part in the latter position, where one of the retaining sections is arranged on the lower part and the other retaining section is arranged on the upper part. The device opposes resistance to pivoting of the upper part from the latter position to the former position.
